1. Summary

Summit Technology Lab (STL) is a deep tech company commercializing AI-powered calibration software for immersive projection systems. Its core product, Artemis, automates multi-projector calibration across domes, curved walls, and irregular surfaces, reducing setup from days to minute, thereby making immersive displays scalable, repeatable, and affordable even for lower end productions. The company is headquartered in Irvine, California and led by Dr. Aditi Majumder, a professor of computer science and internationally recognized expert in projection systems and display calibration.

The immersive ecosystem is growing rapidly. Global AR/VR is projected to grow from ~$60B to ~$200B by 2030. The broader immersive entertainment market is expected to reach ~$459B, growing at 20–30% CAGR. One of the fastest-growing segments, museums and cultural experiences, is forecast to grow from ~$6B to ~$24B by 2030. These segments rely on projection-based installs as a highly affordable alternative to LED based solutions which can cost up to 300x more per linear foot of display for new installs. Immersive experiences can involve complex implementation model put together by A/V integrators with potentially long (9-36 month) sales cycles depending on projects, and require insider business development and focus on partner and channel sales.

We met Aditi at the SV Forum for Golden Seeds late September. We were impressed by the founder's domain expertise and her vision to make immersive Holodeck like experiences accessible to everyone. Since then, we have conducted due diligence talking to partners & integrators, her STL defense advisor, her team members, and reviewing financials and IP. During that time, STL has also advanced commercial traction, including an 80-license contract with Panasonic, additional enterprise LOIs NVI-AP, multiple smaller contracts, and conversations with large scale integrators such as PRG and other leading projector companies including Sony and Epson. Based on our diligence, we believe this is an advanced category-defining technology that is strongly IP protected.

2. Deal Terms and use of proceeds

The company is raising a $500-$750K convertible note in anticipation of a $3M priced round in Q2 2026. The note has a $10M valuation cap (or 20% discount), 6% interest rate and 24-month maturity. They have several interested investors already for the next round including strategic partners Christie Global, Panasonic and Sony. STL has previously received over $6 million in non-dilutive funding from defense research agencies.

The company intends to use funds from the current round to expand its sales and marketing efforts to build out channel partnerships (28%), engineering work to deepen media server integrations, develop additional product features needed for broader adoption, and support for customer deployments, and R&D for future roadmap (60%), and G&A including operations, finance and legal/IP (12%).

3. Investment Hypothesis

STL enables projector systems to become as easy to deploy as LED, with significantly lower cost and higher flexibility, unlocking massive markets previously constrained by setup cost and operational complexity. The mid-market expansion is still nascent and ecosystem partners such as PRG, Christie Global and Panasonic are looking for advanced low-touch technology that enables them to capture market share. On the high end, the technology could become the "Nvidia + Dolby of immersive projection" by becoming the core mapping engine embedded in projection-based immersive deployments and providing foundational software layer powering a new generation of AI-driven, spatially aware display environments.

Key Positives

1. Technology/IP and Product

Artemis offers fast, accurate calibration for complex projection environments. STL is the only fully automated, hardware-agnostic solution that works across integrators, manufacturers, and media servers. It reduces setup time from days to minutes, with little need for post-install support. Professor Aditi Majumder is a global leader in projection mapping and calibration, has built a strong technology team over 50 years of experience, and the company holds 7 granted patents and 2 pending, supported by exclusive usage rights creating a strong moat.

2. Validation and Competitive Advantage
We were able to see real time validation from senior leadership at PRG, an industry leading productions group. They went from skeptical in our discussion to impressed by the technology on their first meeting with STL - "Oh WOW… did this just calibrate in 3 minutes?!" was their first reaction. This is consistent with the feedback we got from TechMD (integrator), and Pixera (media server company) who has pitched them to customers as the *only* company that does what they do. They are working with several projector OEMs including Panasonic (under contract), Sony and Epson, who have stated it is far ahead of their own R&D. Christie Global is also interested in a strategic investment. Both Panasonic and PRG have discussed exclusivity indicating that this innovation will give them competitive advantage. *More details in customer and sales section*.

3. R&D Capital efficiency and Scalable unit economics
The company has raised less than $350K in equity, supported by over $6M in non-dilutive SBIR funding. Artemis licenses at ~$2,400 per projector, with an additional $700 implementation fee and $550 annual maintenance contract. Their investment in low-touch servicing allows STL to scale through partners with minimal overhead. They will continue to apply for SBIR grants as well.

4. Returns analysis for convertible note holders range from a conservative 3.7x (earlier strategic acquisition) to 24.5x (category leader in 6 years) and 38.5%-79.1% IRR. We used a conservative 5-8x multiple, delayed revenues by 1 year, assumed $600K raise on this Note and a 10% option pool prior to next raise. We expect this to likely be a strategic acquisition to provide competitive differentiation. *See exit analysis section*.

Scenario	Annual Revenue	Revenue multiple	Exit Value	Exit Year	1st Equity Raise	2nd Equity Raise	Note Return Multiple	Note IRR
Early Strategic (Lower)	$10M	5×	$50M	29-Dec	$3M @ $18M (Aug-26)	None	3.7x	38.5%
Early Strategic (Upper)	$10M	8×	$80M	29-Dec	$3M @ $18M (Aug-26)	None	5.9x	55.9%
Ecosystem Tool (Lower)	$25M	5×	$125M	30-Dec	$3M @ $18M (Aug-26)	$10M @ $50M (Jun-28)	7.6x	50.3%
Ecosystem Tool (Upper)	$25M	8×	$200M	30-Dec	$3M @ $18M (Aug-26)	$10M @ $50M (Jun-28)	12.2x	65.2%
Category Leader (Low)	$40M	8×	$320M	Jun-31	$3M @ $18M (Aug-26)	$10M @ $50M (Jun-28)	19.6x	71.9%
Category Leader (High)	$40M	10×	$400M	Jun-31	$3M @ $18M (Aug-26)	$10M @ $50M (Jun-28)	24.5x	79.1%

4. Risks

While there is incredible potential for the technology, there are a few key risks:

1. Founder's lack of commercial/startup experience
The founder has operated primarily in an academic domain and has limited experience in the commercial sector. Limited GTM/Sales experience with revenue currently fueled through founder-led sales motion. Can they move from high horsepower to commercial execution at scale as they acquire more customers?
Mitigation: Aditi learns quickly and has been highly coachable during our conversations. STL is aware of this gap. She has hired a seasoned fractional CFO/COO with two exits to complement her skillset. They have already

started actively interviewing sales candidates in anticipation of the raise. Aditi has shown the ability to attract and close contracts in the meantime.

2. Sales and Revenue
Their current pricing model may not work for various use cases such rental markets, high-end implementations with multiple projectors where cost would be prohibitive to profitability, single use for setup/unblocking of installations, and other expansions such as billboards, TV&film backgrounds, etc. Integrators may require handholding for some higher-end implementations price with fairly long sales cycles (9-36months).
Mitigation: The company is open to working out different pricing structures for various use cases and their CFO has experience with modeling utilization-based pricing. They have not factored rentals into their bottoms-up market analysis and have been conservative with year 1 estimate in their financials to account for this.

3. Competitive pressure from LED display technologies
LED is gaining popularity for high-ambient-light and modular installations. Many projector companies are also investing in LED, which could shift spend away from projector-based solutions.
Mitigation: STL is currently best suited for environments with curved or irregular surfaces where LED is costly or impractical to maintain (mid-market). Technology can be extended to support LED edge-blending and color-matching, preserving optionality in an evolving market. PRG will be lending them LEDs to assist with this R&D.

5. Business Model

STL operates a software licensing model supplemented by implementation services and optional annual maintenance contracts (AMCs). Its core product, Artemis, is sold on a per-projector basis, typically through AV integrators or OEM partners who bundle STL's solution into larger deployments.

The current commercial pricing is:

- Per-projector license: Average ~ $2,400 (discounted off list price of $5,000) for a 5-year license
- Implementation fee: $700 per projector (covers camera layout design, configuration, and installation)
- Annual maintenance contract (AMC): $550 per projector per year

Implementation is the company's most labor-intensive activity but is expected to scale through process standardization and system monitoring tools currently in development. Artemis's high degree of automation has led to minimal post-deployment support needs to date.

STL has designed its model to scale through channel partnerships, particularly with integrators and media server companies who bundle Artemis software into their projects as a projection mapping engine embedded within broader immersive display systems (analogous to an "Intel Inside" model in the AV ecosystem). This enhances their ability to provide value and scale without requiring a large direct salesforce.

The company has considered licensing its core software through OEM or white-labeled configurations. This approach requires software modularization and interface customization, currently scheduled for the longer-term product roadmap. STL intends to revisit this embedded licensing strategy after achieving stronger product-market fit in its current integrator-driven deployments.

STL plans is exploring alternatives to this model for a variety of use cases including rentals. This includes a utilization-based solution or a single use with follow-on subscription model. They can expand recurring revenue base through increased AMC and feature-tiered pricing for future capabilities such as dynamic surface

calibration, gesture-based interactivity, and more advanced media server integration that can be offered via subscription or usage-based pricing models similar to some other AV solutions including camera SW.

6. Management Team

Professor Aditi Majumder, Founder and CEO, is a recognized expert in computer vision and immersive display systems with over two decades of academic and applied experience. She holds over 100 patents, has authored foundational texts in projection mapping, and has served as an advisor to organizations including Disney Imagineering and Cubic Defense. Professor Majumder has led STL since inception building out a high-functioning technical team with a lean and capital-efficient operations.

Bharati Jha, Chief of Software Engineering, brings over 20 years of experience in software architecture, team leadership, and deployment at scale. She previously held roles at Unisys and PIMCO. STL's engineering team includes five full-time engineers and one part time engineer, most with advanced degrees in relevant fields and over three years of tenure at the company.

Chiranjib Pal (CP) is STL's fractional CFO+COO. He has co-founded and exited two prior startups and currently advises several early-stage companies. He oversees STL's financial operations, strategic planning, and business infrastructure.

Stephen Clark, former CEO and current Defense Advisor, is a retired U.S. Air Force Major General with over 35 years of service. He holds 15% equity in STL and plays an active role in defense-sector engagement and strategic introductions.

Gopi Meenakshisundaram, Associate Dean of UC Irvine's School of Information and Computer Sciences, advises STL on technical methodology and IP strategy. He holds 9% equity and was instrumental in STL's early university partnerships and licensing.

STL currently has 6 full-time employees. The company plans to create a stock option pool to provide deferred compensation and incentivize retention through the next funding round (see Cap Table for details) due to their below-market compensation.

During diligence we conducted reference conversations with industry partners (Pixera, TechMD, Christie), defense advisor (Stephen Clark, USAF), and current team members. The feedback was consistently strong on Aditi's technical depth, thoughtfulness, and leadership maturity. She is viewed as a mission-driven founder with a clear product vision and an ability to communicate across technical and business domains. References noted that her leadership journey is evolving around prioritization, resource delegation, and scaling GTM&Sales.

The team members describe STL's culture as open, focused, and highly mission-aligned, with Aditi setting a tone of autonomy and shared accountability. The engineering team is still small and relatively young, requiring mentorship and tight prioritization. The engineering lead with >20 years of engineering experience highlighted STL's move from a research-centric mindset to a more productized, customer-centric approach as a key evolution in the company's trajectory.

7. Technology/IP Assessment

STL Artemis automates calibration of complex multi-projector environments using AI-driven computer vision and multi-camera systems. The software builds a 3D digital twin of the projection surface and optical setup, enabling

calibration without markers, scanners, or precise hardware placement. Artemis supports real-time recalibration, functions in ambient light, and achieves sub-pixel accuracy with edge blending and color correction.

The company's IP portfolio includes eight patents: seven issued and one pending. Of the issued patents, six were assigned by the inventors (including Aditi) to the University of California, Irvine (UCI), and one was filed and is owned by STL. The remaining patent is pending and was filed by STL. STL holds exclusive, perpetual licenses to two of the UCI patents currently used in production and has the right to receive exclusive perpetual licenses to the remaining four UCI patents for future product development. The founder has a longstanding relationship and partnership with UCI due to her tenure there.

There appear to be no challenges to the issued patents at the Patent Trial and Appeal Board. Since the pending application does not appear to have been published, no information is available via the public records at the Patent Office. The company pays a 2.5% royalty on sales that leverage these licensed patents. Knobbe Martens conducted a $40,000 evaluation of the UCI IP prior to commercialization, and STL has since invested an additional $200,000 to strengthen and expand patent claims based on their recommendations.

Artemis is currently integrated with Pixera media servers and is compatible with the MPCDI data exchange standard. STL is pursuing additional integrations with Green Hippo, Seventh Sense, and Disguise, and is working toward NDI compliance to reduce dependence on deep server integrations. STL has also developed a proprietary media server and rendering solution, which has been deployed for small-scale customers, although the company does not intend to pursue hardware as a scalable revenue stream. These implementations have occasionally generated consulting revenue but are considered opportunistic rather than strategic.

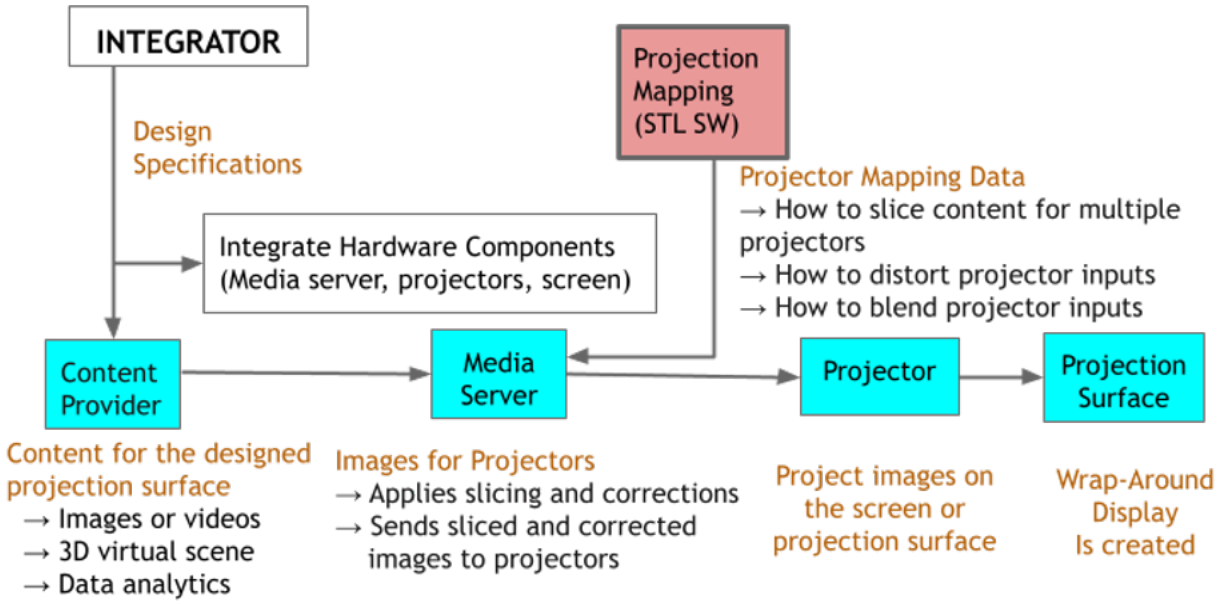

Figure 1: Work Flow between different vendors in an immersive environment ecosystem.

8. Product

Artemis is currently deployed in simulation and museum environments, including installations at MechDyne, Regent Craft, and Discovery Science Museum. These customers adopted Artemis after facing limitations with competing tools (Scalable, Vioso) and have since cited automation, low-touch operation, and reliability as key

benefits. STL has made minor UI enhancements in response to early feedback but continues to emphasize simplicity and automation as core design principles.

Technical work funded by the current bridge round will focus on three areas:

- Implementation and Support (~40%): Deployment assistance handled by STL's engineering team, covering camera layout design and install support. Maintenance needs have been minimal and are expected to remain low.
- Product Engineering (~40%): Development underway on high-priority features requested by customers: black offset correction, color matching, and white balancing. The team is also formalizing and packaging advanced blending/interaction modules (e.g., tablet-based controls).
- R&D (~20%): In house development of dynamic surface calibration and large-scale motion capture so STL retains IP ownership. Future SBIR grants may offset and/or reduce these costs.

These improvements are designed to extend Artemis's capabilities across a wider range of surfaces, use cases, and environments. Longer term roadmap includes support for dynamic projection surfaces and user-aware content interaction, including markerless tracking and gesture response. These advancements will position Artemis as a flexible platform for adaptive, immersive installations across entertainment, training, and experience design.

Artemis is currently Windows-based, with a Linux-compatible version under consideration based on customer demand in simulation. STL has completed integration with Pixera media servers and is pursuing additional partnerships with Green Hippo, Seventh Sense, and Disguise. It is also working toward NDI compliance to streamline connectivity and reduce setup complexity.

9. Addressable Market

The broader AR/VR and immersive-experience ecosystem is large, accelerating, and shifting toward shared, physical immersive environments. Global AR/VR is projected to grow from ~$60B in 2024 to ~$200B by 2030, while the immersive entertainment market is expanding from ~$125B to ~$459B over the same period (20–30% CAGR). The museum and cultural immersive-experience vertical, directly aligned with STL's projection-based solutions, is one of the fastest-growing segments, scaling from ~$6B in 2024 to ~$24B by 2030 (~27% CAGR).

Within this broader landscape, the entertainment and Location-Based Entertainment (LBE) verticals such as theme parks, immersive attractions, interactive venues, VR/AR arcades are experiencing even faster growth. The global LBE market is rising from ~$5.6B in 2024 to ~$26B by 2030, with 20–30% CAGR across studies. Hardware-driven immersive installations (projection mapping, large-format displays, LEDs) dominate spend, with amusement parks representing roughly 40% of LBE end-use. Demand is fueled by consumers seeking social and immersive out-of-home experiences, and by venue operators looking for differentiation, propelling the rapid adoption of immersive displays, multi-projector environments, and projected-space experiences.

This positions STL at the center of this large, accelerating opportunity: enabling fast, reliable, and repeatable deployment of immersive spaces through automated calibration and mapping technology where manual calibration presents ongoing technical and cost challenges. The company estimates a total addressable market (TAM) of $12 to $15 billion, based on a combination of top-down and bottom-up analyses.

Using sales data from the top 10 projector manufacturers, including Epson, BenQ, Optoma, NEC, Panasonic, Sony, Barco, Christie, and others, STL estimates that approximately 2.3 million projectors are sold annually in the

U.S. Of these, about 930,000 are used in multi-projector environments with projection mapping requirements. Based on STL's average per-projector pricing ($2,400 license, $700 implementation, and $550 AMC), the U.S. TAM is estimated at approximately $6.2 billion. Assuming the U.S. accounts for 40 percent of global sales, this implies a global TAM of approximately $15.6 billion (*Bottom-Up Analysis*)*

Third-party sources estimate the global immersive environments market at approximately $150 billion. STL conservatively estimates that 50 percent of these environments rely on projection-based systems, and that 15 percent of that spend is allocated to projection mapping software. This approach yields a comparable TAM estimate of around $12 billion. (*Top-Down Analysis)*

STL estimates the U.S. represents approximately 60 percent of the near-term opportunity, resulting in a serviceable addressable market (SAM) of $7.5 billion. With STL product maturity, early customer traction, and current GTM focus, the company is targeting $100 million in cumulative revenue over the next five years (SOM).

Sources referenced include: Projector Central, PMA Research, Mordor Intelligence, Market Growth Reports, Fortune Business Insights, Precedence Research, and Grand View Research.

10. Sales and Marketing

STL is targeting a layered customer ecosystem in which end users typically contract with system integrators, who coordinate components including projectors, media servers, content providers, and projection mapping software. STL's software is positioned as a core technology within this stack and is most often embedded by integrators or media server partners into turnkey immersive display solutions.

STL has relied on founder-led outreach through trade shows, LinkedIn, and industry relationships to build early traction. This has helped the company validate demand, refine its value proposition, and secure pilot deployments. Current commercial activity provides evidence that a channel-partner-led GTM model is viable, but approach has not been formalized into a scalable sales motion. The company has not yet invested significantly in sales or marketing.

The company is in the early stages of building a repeatable go-to-market strategy focused on enabling resellers, integrators, and media server companies to serve as primary sales channels. Initial branding, positioning, and customer acquisition efforts will be supported by the planned GTM hire and marketing head, both expected to join over the next funding cycle. Near-term goals include formalizing partner onboarding, developing sales collateral and technical documentation, and establishing co-marketing programs with select channel partners.

11. Customer and Sales Pipeline

STL has generated $125K in revenue over last 2 years from three customers: MechDyne (Canon lobby), Regent Craft (flight simulators across three sites), and Discovery Science Museum. Each customer adopted Artemis after encountering limitations with competing calibration software, citing STL's automation and deployment efficiency as key differentiators. STL generated $210K in revenue during MVP stage (prior to 2020).

As of Q4 2025, STL has accelerated sales activity and is actively contracting with four new customers:

- Panasonic: STL has finalized an agreement with Panasonic for 80 projector licenses. The contract is valued at $450K with $250K projected within the next six months and further expansion interest.
- NPI-AV: A commercial integrator expected to contract for 144 projectors, with projected revenue of approximately $1 million with $500K expected over the next 12 months.

- Limelight Art and AV-Chicago: Two smaller commercial opportunities totaling $73,000 in projected revenue, with $47,000 expected in the next year.

STL recently completed a diligence call with PRG (Production Resource Group) one of the world's most respected live-event production companies (>$1B Assets, $750M+ revenue, 10,000+ shows/year, including 90% of Broadway and major events like the Super Bowl and F1) through an introduction from a Golden Seeds member. Initially skeptical of STL automation and AI claims, PRG leadership, including their Chairman, Head of Innovation, and technical field manager engaged in a lively discussion with Aditi and her team. The real-time demonstration of Artemis calibration shifted the tone entirely to being impressed followed by rapid-fire technical questions and discussions around facility visits, licensing, exclusivity, and lending of HW/SW for R&D purposes. PRG plans to visit and partner with STL to discuss GTM and pricing for their specific rental model.

We also spoke with several evaluation partners: TechMD Inc (integrator), Pixera (media server), and Christie Global (projector company) in October. The consistent takeaway is that the technology is impressive and competitors do not have similar level of auto-calibration capabilities. This includes companies like Panasonic that have been working on competing R&D which is far behind. Media server partner Pixera has enabled native integration with Artemis and has committed to referring STL in 50 to 70 projector opportunities annually, including a last-minute deal to unblock an immersive African American museum launch (completed in <2 hours).

STL is in active discussions and early pilots with Boom Aerospace, AVI-SPL, TechMD, Mechdyne (for follow-on work), Sony, Christie, Epson, Pearl Harbor, and Rabcup. Many of these are integrators or hardware partners and will embed STL in their broader immersive display positioning. STL is in discussions with Disguise and Seventh Sense to establish similar integration relationships/partnerships.

On the defense side, STL engaged in several exploratory efforts including discussions with the Naval Warfare Information Command (NWIC), KBR, and Panasonic on DARPA-related simulation initiatives. The company will continue to apply for SBIR grants to support R&D and IP development. While STL does not expect defense-related revenue to be a material contributor over the next two to three years, strategic partnerships with projector OEMs such as Panasonic and Christie may accelerate access to these markets.

12. Competition

STL competes in the projection mapping software segment, which includes legacy manual solutions and partially automated systems offered by companies such as Scalable Displays, Vioso, and Epson Pixel Align. These tools typically rely on a single camera, iterative alignment workflows, and manual grid manipulation. While effective in simple or flat environments, they struggle to scale to large or non-planar surfaces and often require skilled technicians, extended setup times, and precise hardware placement. OmniCal uses multiple cameras but continues to rely on manual calibration processes and lacks STL's deterministic 3D recovery.

Artemis distinguishes itself by using AI and multi-camera vision to generate a 3D digital twin of both the projection surface and the optical system. This enables fully automated calibration across complex geometries without markers, laser scans, or manual adjustment. STL's method allows for sub-pixel accuracy, rapid deployment, and low-friction maintenance, including recalibration in ambient light and on dynamic surfaces. STL competitive positioning relies on a combination of proprietary software, integration with media servers, and defensible IP. Its core differentiators include speed, flexibility, hardware tolerance, and scalability.

Projection mapping competes with LED-based immersive display solutions which eliminate calibration complexity and offer high brightness and visual uniformity. However, they come with significant cost and have potential downsides of needing to stockpile extra LEDs for color uniformity. They are often impractical for domes, large-scale curved environments, and cost-sensitive training or museum applications.

13. Financials

STL has historically operated in a lean, engineering-driven mode and is currently pre-profit with limited commercial traction. However, booked revenue has materially increased over the past quarter, with commitments from Panasonic, NPI-AV, and others indicating growing market confidence. This momentum, combined with early partner enthusiasm and pipeline depth, suggests that the company's forward-looking growth trajectory is directionally reasonable. The company projects revenue of $764K in FY2026 based on current pipeline generated mainly since August 2025.

	Q1 26	Q2 26	Q3 26	Q4 26	FY 2026
Revenues					
License Revenues	116,520	119,625	157,036	157,036	$550,218

Total Operating Expenses	343,306	360,251	443,624	563,125	1,710,305
EBITDA	**-206,971**	**-191,419**	**-217,834**	**-330,382**	**-946,607**
EBITDA %					
Number of licenses sold (projectors)	44	48	62	62	216

The 5-year projection includes assumptions for expected growth based on sales and marketing investment and capturing a number of the overall projectors sold for industry verticals (LBE and Simulations) to get to $10.1 million by FY2028. Growth is expected to be driven initially by license sales and implementation services, with SaaS and AMC revenue scaling in later years. By FY2030, STL anticipates 8,333 projector licenses sold, up from 216 in FY2026 to capture <1% of projector market. Gross margins remain strong across the forecast period, averaging 84% to 90% from FY2027 onward. EBITDA turns positive in FY2028 (9%) increasing to 37% in FY2030.

From an operations standpoint, implementation remains STL's most labor-intensive service but is directly billable to customers. The company has seen very few post-installation service calls to date, most of which have been resolved remotely. STL is also investing in system logging and monitoring to further reduce long-term

servicing overhead. Annual maintenance contracts (AMC) are expected to remain low-effort, high-margin. Cost structure investments will shift toward go-to-market over the next two years, with material increases in sales and marketing spend. The company plans to hire dedicated GTM leadership and begin building repeatable sales motions and partner enablement infrastructure. Engineering spend is expected to stabilize as the product matures and deployment workflows become standardized.

14. Exit Strategy

STL positions itself as a core infrastructure technology for large-format immersive environments that are increasingly leveraged in entertainment, training, simulation, experiential retail, and corporate experience centers to power seamless, wearable-free, spatially immersive environments at scale.

STL would be an attractive acquisition target for projector OEMs such as Panasonic, Epson, or Christie, as well as for media server platforms and immersive technology providers seeking to embed calibration software as a differentiator. They frequently acquire enabling software layers that reduce system complexity, unlock new use cases, and expand market adoption. This is consistent with feedback from Christie Global on their past acquisitions (e.g. Coolux). Defense primes like Lockheed Martin and KBR may also have strategic interest, particularly given STL's applicability in simulation and training environments. STL could be a target for:

- Projector OEMs (Panasonic, Epson, Sony, Christie, Barco)
- Defense primes (Lockheed Martin, KBR);
- Media server companies (Disguise, Pixera, Resolume, TouchDesigner ecosystem partners)
- Immersive technology platforms (Unity, Epic/Unreal, emerging experiential stacks)

STL's product roadmap is aligned with macro trends in immersive, wearable-free display systems. If successfully executed, Artemis could become a foundational layer in next-generation projection environments across multiple sectors. A key differentiator is STL's ability to deliver scalable, low-maintenance systems for non-flat surfaces without requiring manual alignment, something few acquirers currently offer in-house. Several acquisitions illustrate the appetite for enabling technologies in the immersive projection space:

- Meta → Oculus (2014) for $2B, establishing the VR ecosystem
- Panasonic → One Network (2025) for $700M+, demonstrating willingness to acquire tech platforms
- AVI-SPL → 26n (2025) at $800M+, underscoring enterprise AV consolidation
- Ross Video → ioversal (Vertex) (2025), immersive AV platform
- Christie → coolux (Pandoras Box), projection mapping and media-server infrastructure
- Niantic → 8th Wall, leading WebAR platform
- Snap → WaveOptics, AR display / waveguide technology for $500M+

While STL is earlier in its growth trajectory, its focus on repeatable, scalable deployment in a capital-efficient model gives it a path to strong strategic value. Based on forecasted revenue growth, an exit valuation in the range of $250 million to $500 million is a reasonable target. This implies potential return multiples of 10x or more for early investors, assuming continued traction and commercial execution.
