Company

- Now that SBIR funding has thawed, what would STL be eligible for moving forward? Is anything in flight and what would the timeline look like?

  There are still some opportunities we can still go for. We have **one SBIR pending** which we will get to know about once the SBIR funding gets approved by the House. We are also **working with SAI Associates (a prime contractor) on two SBIRs, one for DHS and another for DOT.** However, the current financial model does not depend on any SBIR funding.

  These opportunities will mature only by Q4 2026. This will help us to move some of the R&D expenses to the SBIR funding freeing up resources for additional S&M efforts.

Technology

- You mentioned you have exclusive perpetual licenses to the UCI patents. Are there milestones remaining for any of them or do you already have access to all of them?
  We have 6 UCI patents. We have already licensed 2 of them - **exclusive perpetual license.** These patents are being used in the current revenue generating product. We are paying 2.5% royalty (together for two patents) on net sales. We have **exclusive right to perpetual license** for the other 4 UCI patents which we will license for subsequent versions of the product in our tech roadmap. We also have a growing portfolio of STL patents - 1 issued and 2 pending.

- In addition to the perpetual license, what are the change-of-control provisions/can the license be assigned or does UCI have approval rights?
  We have the r**ight to sublicense** and the **license will transfer as is with change of control** – unless the new owner wants to renegotiate.

- Does 3-minute calibration hold across all geometries or do some take longer?
  The time for calibration **depends on the number of projectors,** but **does not increase proportionally with the number of projectors**. Just as a reference, though 4 projectors take around 4 minutes, 32 projectors take around 10 minutes. This time does not depend on kind of projectors or types of overlaps and therefore almost always they are multiple orders of magnitude better than the human assisted version.

- Which media servers are you compatible with today vs still working on? Estimate what market share you're compatible with today.
  We are **compatible with all servers that accept MPCDI format.** Almost all servers in the market accept this format. Our software output can be consumed by any media server as long as this format is supported. For deeper integration, we are now working with Pixera, Disguise and 7th sense.

- The real-time/dynamic calibration capability demo was impressive. You mentioned it was MVP. What is the timeline/milestones to making real-time/dynamic calibration production-ready? Is this funded in the current raise and does it require another SBIR?
  This capability was developed using a SBIR. We **plan to launch it in Q3-Q4 2026**. We are currently productizing it. This will be done using the proceeds budgeted for R&D and improving the product.

Cap Table and Term Sheet

- From the cap table it looks like Stephen Clark is fully vested already. Are there plans to give him more equity? What's the vesting schedule for Gopi and Aditi?

  There is no plan to provide Stephen Clark with additional equity. He is fully vested. Following is the vesting schedule for Gopi and Aditi.

Name	# of shares	Exercise Price	Type (ISO or NQO)	Vesting Start Date	Vesting Schedule
Aditi Majumder	923,000	$0.04	ISO	11/21/2025	Fully vested as of the Vesting Start Date.
Aditi Majumder	7,650,000	$0.04	ISO	11/21/2025	1/42nd per month over forty-two (42) months with a 6-month cliff such that 6/42nds vest on the six-month anniversary of the Vesting Start Date and 1/42nd vests monthly thereafter.
Gopi Meenakshi sundaram	385,000	$0.04	ISO	11/21/2025	Fully vested as of the Vesting Start Date.
Gopi Meenakshi sundaram	385,000	$0.04	ISO	11/21/2025	1/42nd per month over forty-two (42) months with a 6-month cliff such that 6/42nds vest on the six-month anniversary of the Vesting Start Date and 1/42nd vests monthly thereafter.

Use of Funds

- What's the use of funds for the current funds?

  We are at an inflection point for revenues. 46% of the fund will go to GTM and customer success. 42% will go to R&D for new capabilities and improving the current product. Rest for G&A.

Company Financial Model & Assumptions

- What's your runway look like? What's your monthly burn and cash in the bank? We remember hearing you have cash in the bank for about 3 months. Do you have plans to fund the company if closing the rest of your round takes longer than that? Even if you do close the round, how much time does that buy you? Have you already started talking to VCs about your next round? What milestones do you need to reach for the next round?

  Our gross burn rate is around $92K per month.

  Our net burn rate is around $72K per month right now but would reduce as the Panasonic revenue starts coming in, NPI-AV revenue increases and we sign more contracts via our new VP of Sales. We are reducing the burn since the CEO and COO are working without taking cash compensation.

  Current cash at the bank is $250K. We have a runway of around 3 months.

  We are in DD with several groups and anticipate closing the $750K round by mid April. In fact, we feel that we can go above to $1M-$1.25M with permission from Golden Seeds.

  $750K will buy us time till Q4 2026. But, if we raise $1M-$1.25M, we can comfortably go to Q1/Q2 of 2026. We are already in discussion with a few VCs.

GTM & Revenue Model & Growth

- Can you summarize the nature of your revenue from customers? What's already in the bank vs future revenue? What milestones remain?
  Currently we are selling software for permanent installations on static surfaces. For capex oriented customers, we do a 5 year license for $10,000 per projector. For opex oriented customers, we do an annual subscription fee of $2,600 per projector. For both we charge a one time implementation fee of $1,000 per projector to cover for the camera placement design and remote software configuration/deployment.

  In future, we plan to have other revenue channels as follows.
  (a) Rental and Staging use case where we will charge a per-week per projector revenue. We are talking with PRG and NPI-AV already and have found that a $200-$250 per week per projector pricing is quite acceptable.
  (b) Currently, the software is used by AV integrators or projector manufacturers or media server companies who are still used to high quality expensive projectors. In future we would like to provide the software for more consumer dominated applications (e.g. a two projector wall, or a three projector curved gaming display). These use cases will most likely use less expensive projectors. We want to launch a cloud based easily downloadable version of the software for these simpler applications.

(c) We are going to launch the dynamic surface software which will become more attractive for mobile applications.
(d) We have not monetized our interaction solution yet and customers have just started showing interest in them. Our laser and tablet based solutions are in their alpha stage of production.

- What is your go to market strategy going forward?
  Our GTM remains centered on selling via channel partners. Channel partners are of three types.
  1. **Projector Manufacturers:** These are companies like Epson, Christie, Barco, Sony and Optoma. We are already working on a trial license with Optoma and in discussion with Christie, Sony and Epson. We are in contract with Panasonic for 80 projectors in 6 months, followed by a global roll-out plan.
  2. **Integrators:** These are AV integrators who provide turn key solutions for end users. We are in contract with NPI-AV for 144 projectors over 24 months. We are in discussion with PRG, AVI-SPL, and several others.
  3. **Media Servers:** These are companies who provide the rendering solution to push millions of pixels in real time. We are already working on a trial license with 7th sense, are in discussion for a deeper integration with Pixera, and in initial discussions with Disguise and Green Hippo.

  Beyond that we are also pursuing direct sales strategies with primarily three types of customer segments.
  - Themed Entertainment or Immersive Experience Companies (e.g. Universal Creative, Thinkwell Group, Falcon's Creative Group)
  - Venue Operators or Venue Organizations (e.g. Oak View Group, ASM Global, Hard Rock International)
  - Experiential Marketing Organizations (e.g. George P. Johnson Experience Marketing, Freeman, Jack Morton Worldwide)

- How do you plan to scale your support service model?
  Since our software is fully automated, support calls are minimal for us. From the past installations, we have received less than 1 call per quarter per installation. Most of the time they are tier 1 issues of hardware changes or software environment issues which are resolved within minutes. Very rarely (maybe once a year) we have faced tier 2 technical issues. Even those have been resolved in a couple of hours max.

  We plan to train our channel partners for Tier 1 issues and only Tier 2 issues that are deeply technical and troubleshooting will come to us. In fact, we have already trained Panasonic engineers for Tier 1 support for our partnership.

  Currently our core technical team is handling the customer support. However, in future we plan to hire support engineers as the volume grows.

- What is the preferred route to market, direct to a customer or indirect via some type of partner?
  As mentioned above, we plan to use a mix of channel partner based sales and direct sales.

- What do you envision the mix of direct vs. indirect as the company matures?

  STL expects the majority of deployments to occur through **channel partners**, including system integrators, projector manufacturers, and media server companies. Direct engagements represent a **small portion of the funnel (approximately 15–20%)**. These early direct projects help demonstrate market demand and create opportunities that can be shared with potential partners. As the company matures, the model is expected to remain **predominantly partner-led**, with STL focused on enabling and supporting the broader ecosystem rather than competing with it.

- Under what conditions will the company sell direct?

  STL will engage in direct sales in situations to support technology validation and market development. These engagements typically involve early adopters willing to deploy the platform in real-world environments, allowing STL to establish reference installations and demonstrate the solution's viability.

  Direct engagements may also occur as STL uncovers **new application areas and markets created by the technology**, where initial deployments help validate use cases and demonstrate demand to the broader partner ecosystem.

- In terms of indirect, which is the primary model?
  - Company -> Distributor -> Partner -> Customer
  - Company -> Partner (OEM) -> Customers
  - Company -> Partner OEM) -> OEM Partner -> Customer
  - Company -> Partner -> Customer
  - Company -> Customer -> Partner (i.e., the company sells direct, with the partner doing the deployment/integration services)

  Our primary model is Company -> Partner (Customer) -> End User
  Our partners are buying the product from us and selling it to end users.

- When you talk about Panasonic as a partner, are they integrating with their solution and selling directly to a customer or is Panasonic selling through one of their partners?
  Panasonic currently is not integrating with their solution, but a deep integration can happen in the future. Currently they are selling either through their partner or directly to the end user.

- What are the thoughts on MSP pricing (available to customers) and resulting margins to partners, be they distributors, OEMs of integration partners?
  Our partners can make a 25-35% margin. As we establish Product Market Fit we will be in a position to reduce the partner margins.

- What is the mix of current partners—i.e., OEM vs. integration?

  We are currently focusing equally on these two partner channels.

- What is the ideal partner profile (IPP) for an integration partner?

  STL's ideal partners are leading AV and experiential systems integrators that design and deploy immersive environments for venues such as museums, sports arenas, themed attractions, corporate experience centers, and government facilities. Typical partners include firms like Diversified, AVI-SPL, PRG, and NEP Group—organizations that influence technology decisions early in the design phase and can integrate STL into broader AV ecosystems, enabling scalable growth through existing partner channels. It also includes projector manufacturers (E.g. Panasonic, Optoma, Christie, Barco) and Media Server providers (e.g. Disguise, Pixera, 7th Sense) who also work closely with such AV integrators to influence design decisions early on and sell their hardware products.

- In terms of services revenue, what is the ratio of product to services—i.e., for each dollar of STL software sales, what are the services dollars attached?

  Our SaaS pricing is $2,600 per year and one-time implementation fee is $1,000. Considering 5 years of ownership, the subscription revenue will be $13,000 and services revenue will be $1,000. Therefore, services revenue will be 7% of the total revenue.

Market

- While the SAM is estimated at $7.5B, which specific sub-vertical (Museums vs. Simulation vs. Location-based Entertainment) has shown the shortest sales cycle and highest willingness to pay to date?

  We have sold to each of these segments, but sample size is too small to compare the difference in sales cycles and willingness to pay. As we enter into repeatable GTM motions, we anticipate we will be able to get good data on these in the next 6-9 months.

Team

- What is the specific day-to-day involvement of technical advisor Gopi Meenakshisundaram and defense advisor Stephen Clark beyond strategic introductions?

  Stephen Clark works on providing strategic introductions, writing of whitepaper and proposals for SBIRs and responses to BAA.

  Gopi Meenakshisundaram holds weekly meetings on algorithmic development and Innovations with the technical team. He is also responsible for all patent related activities

and is the main interface between the technical team and the patent lawyers.

Competition

- Who are your closest competitors and how is your solution differentiated?

  Our main competitors are Scalable Displays, Omnical and Vioso who offer camera based calibration solutions. However, they cannot scale to any kind of surface and any kind of projectors. They usually address regular surfaces like a cylinder or sphere or a wall. An irregular shape like a vase or football or a S-shaped wall is almost impossible for our competitors to handle. In addition, they usually need markers on the projection surface or a prior scan of the environment as an input to their software. Interaction and handling dynamic surfaces are capabilities none of our competitors can provide. Other competing SW are those from projector manufacturers (e.g. Panasonic Geometry Pro, Epson Pixel Align) which are heavily limited in their capabilities. For example, Panasonic's Geometry Pro uses a single camera and provides a grid based user interface that has to be tweaked manually. By Panasonic's own admission, our software is 10 years ahead of theirs. Epson's Pixel Align works for a limited number of projectors only on flat surfaces. Therefore, we are a truly disruptive technology.

Exit Assessment & Risks

- You mentioned interest from strategics in the next round. What milestones do they want to see? Has there been mention of the right of first refusal (ROFR)?

  Panasonic has already broached the topic of acquisition. The milestones have not been discussed explicitly. However, the current 6 month project will prove the adoption and demand for our product. ROFR has not been discussed yet.

  However, Panasonic is not the only potential acquirer. As our SW gets adopted through GTM motions and awareness of its capabilities are improved via marketing, we anticipate other OEM companies (e.g. Christie, Barco, Sony) or location based entertainment companies (e.g. Disney, Dolby) to be interested in acquisition.
