Autonomous Telemetry

Executive Overview:

This capability allows the AFFIRM platform to monitor AI systems even when those systems do not expose an external API. Instead of AFFIRM sending prompts into the AI, the client's AI system securely sends live questions and responses to AFFIRM's API as they occur. This enables oversight without changing how the AI operates or requiring AFFIRM to connect directly into the client's environment.

Once data is received, AFFIRM automatically evaluates each interaction against pre-configured tests, and then filters and flags any sensitive or personal information. All evaluations are handled asynchronously, ensuring there is no impact on end-user experience or system performance.

The result is a single, consistent view of AI health and risk across the organization. Executives gain clear visibility into performance, safety, and compliance through standardized results, alerts, and health reporting, thereby providing confidence that AI systems are operating as intended while minimizing operational and regulatory risk.

Technical overview:

1. AI Assets in AFFIRM will have two types (only one type will be supported per AI Asset):
    a. **Outgoing API Calls** - existing and default
    b. **Incoming API Calls** - new type
2. Configuration of Incoming Calls AI Asset will be different, it will not require entering API details, and a user will only be able to create and define Tests (evaluator high details), not Prompts (no queries, no ground truth).
3. Evaluators supported by the new Autonomous Telemetry to start are:
    a. Latency
    b. Throughput
    c. Readability (all methods)
    d. Prompt Relevance
    e. Toxicity
    f. Groundedness
    g. Additional Evaluators will be added in the near future, such as PII/PFI/PHI and Structure Format Compliance
4. Results of the Evaluations and Notifications will be available in AFFIRM in the same way as for the existing AI Asset, including SNOW and Email notifications.
5. Real Data will be passed through API and will be an Input for the Evaluator. PII/PFI/PHI will be redacted and flagged.

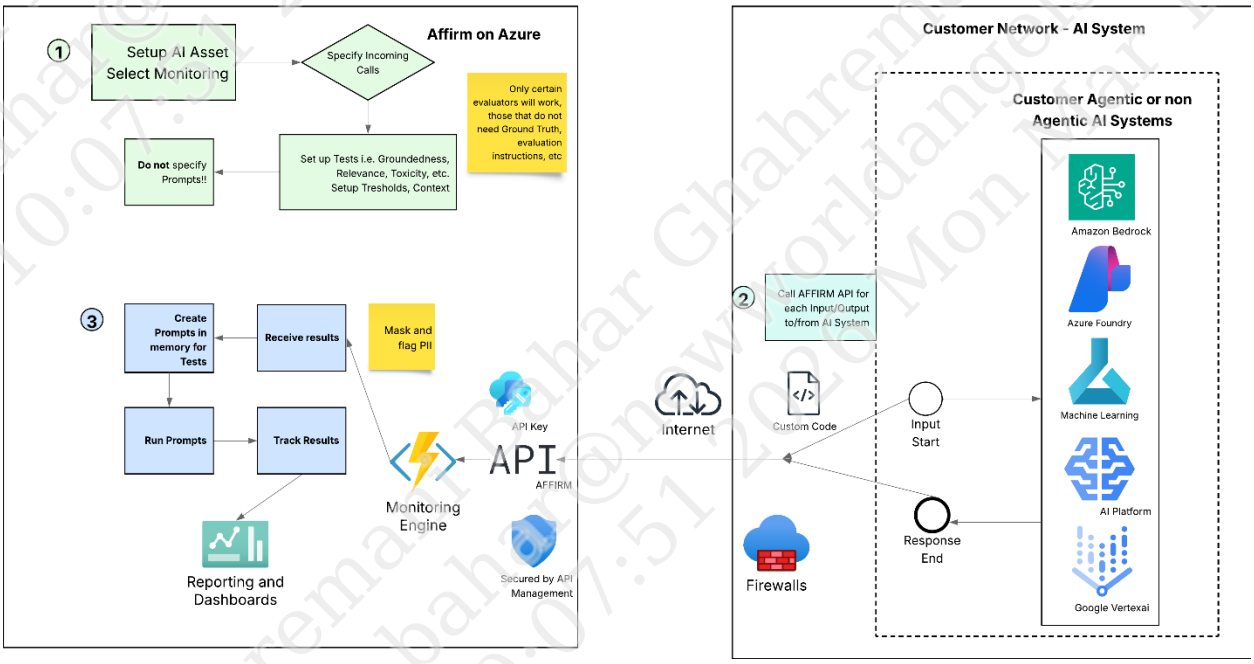
6. A Technical resource from the customer side will need to add an API call into their Software where they will be passing AI System input and output data, specify Test Ids to run for this input/output, provide API Key, Organization and Asset IDs.
7. AFFIRM's API will be REST asynchronous API with the first call - placing a request into the queue and the second call - checking the queue status. Full API specs in attachment.
8. AFFIRM's API will be rate limited and return 429 in the case of breaching the limit.
    a. Detailed rate limitations will be provided as part of the delivery.
9. AFFIRM API Keys can be generated in the AFFIRM UI by the Organization Admin, it is stored in the Key Vault.

Timeline

The estimated duration of this initiative is two sprints, starting on 2/2/26, with delivery to production scheduled for 3/4/26.

Deliverable

Updated cloud infrastructure, client software developer examples on Python, Java, C# and JavaScript.


AFFIRM Autonomous Telemetry for AI
